## PART I QUALITATIVE ANALYSIS FOR DYNAMICAL NEURAL NETWORKS AS SYSTEMS WITH SEVERAL EQUILIBRIA

<b>1</b>	<b>SYSTEMS WITH SEVERAL EQUILIBRIA AND THE CLASS OF DYNAMICAL NEURAL NETWORKS . . . . .</b>	<b>5</b>
1.1	Introduction. State of the art . . . . .	5
1.2	Systems with several equilibria. The theoretical background: notions and basic results . . . . .	6
1.3	Recurrent neural networks as nonlinear dynamical systems with several nonlinearities . . . . .	7
1.3.1	Hopfield neural networks (HNN) . . . . .	7
1.3.2	The competitive Cohen–Grossberg neural networks . . . . .	8
1.3.3	Cellular Neural Networks (CNNs) . . . . .	9
1.3.4	K-Winners-Take-All neural networks (KWTA) . . . . .	9
1.4	Conclusions . . . . .	10
<b>2</b>	<b>STUDIES OF QUALITATIVE ANALYSIS FOR RNNs AS DYNAMICAL SYSTEMS WITH SEVERAL EQUILIBRIA . . . . .</b>	<b>11</b>
2.1	Gradient-like behavior and high gain design of KWTA neural networks . . . . .	11
2.1.1	The network structure and some dynamical properties . . . . .	11
2.1.2	Order-preserving properties of the KWTA circuit . . . . .	13
2.2	Systems with slope restricted nonlinearities and neural networks dynamics . . . . .	15
2.2.1	Introduction . . . . .	15
2.2.2	The main result . . . . .	15
2.2.3	Applications to the case of neural networks dynamics . . . . .	17
<b>3</b>	<b>STUDIES OF QUALITATIVE ANALYSIS FOR RNNs WITH TIME-DELAYS . . . . .</b>	<b>19</b>
3.1	Introduction. Time-delay systems . . . . .	19
3.2	Global asymptotic stability for Hopfield networks with time-delays – Lyapunov-type results . . . . .	20

3.3	Synchronization problems for time-delay RNNs . . . . .	22
3.3.1	A Lyapunov-like approach . . . . .	22
3.3.2	A Popov-like frequency domain inequalities result . . . . .	24
3.4	Robust exponential stability for Cellular Neural Networks with time-delays . . . . .	25
3.4.1	Extension to the case of dynamical neural networks . . . . .	28
3.5	The Popov-like results using comparison for systems with multiple equilibria and time-delays . . . . .	29
3.6	An extension of the LaSalle-like theory for systems with several equilibria and time-delays . . . . .	30

## **PART II APPLICATIONS OF QUALITATIVE ANALYSIS FOR SYSTEMS WITH SECTOR RESTRICTED NONLINEARITIES**

<b>4</b>	<b>SYSTEMS WITH SECTOR RESTRICTED NONLINEARITIES. PIO PHENOMENA . . . . .</b>	<b>37</b>
4.1	The absolute stability problem for systems with sector restricted nonlinearities . . . . .	37
4.2	PIO phenomena . . . . .	39
<b>5</b>	<b>ABSOLUTE STABILITY RESULTS FOR SYSTEMS WITH BOTH SECTOR AND SLOPE RESTRICTIONS . . . . .</b>	<b>41</b>
5.1	The case of nonlinear SISO (single-input – single-output) systems . .	41
5.2	The case nonlinear MIMO (multiple-input – multiple-output) systems with multiple nonlinearities . . . . .	42
<b>6</b>	<b>APPLICATIONS OF ABSOLUTE STABILITY FOR SYSTEMS WITH SECTOR AND SLOPE RESTRICTED NONLINEARITIES . .</b>	<b>45</b>
6.1	Absolute stability applications for SISO systems with both slope and sector restricted nonlinearities . . . . .	45
6.1.1	An absolute stability application for a third order SISO system	45
6.1.2	An absolute stability application for a fourth order SISO system	46
6.2	A PIO II case with crossover PVS (Pilot Vehicle System) . . . . .	46
6.2.1	An application: robustness of the Neal–Smith criterion . . . . .	48
6.3	Absolute stability for roll attitude control system of a fighter aircraft.	49
6.4	Absolute stability conditions for some scalar nonlinear time-delay systems with monotone increasing nonlinearity . . . . .	50
6.4.1	The mathematical model and the absolute stability problem . .	51

## **PART III DISTRIBUTED PARAMETER SYSTEMS: COMPUTATIONAL MODELING AND CONTROL SYNTHESIS**

<b>7</b>	<b>A PROCEDURE FOR COMPUTATIONAL MODELING DISTRIBUTED PARAMETERS CONTROL SYSTEMS - THE CASE OF HYPERBOLIC PDEs . . . . .</b>	<b>59</b>
7.1	Introduction. Motivation. . . . .	59
7.2	Problem formulation. The mathematical model. . . . .	60

7.3	Neural Mathematics approach for developing the computational procedure . . . . .	61
7.3.1	A “convergent Method of Lines” for hyperbolic PDEs . . . . .	62
7.3.2	Cell-based neural networks for mapping formalized problems . . . . .	64
7.3.3	The computational procedure for DPCS modeled by hyperbolic PDEs . . . . .	65
7.4	Some concluding remarks . . . . .	67
<b>8</b>	<b>COMPUTATIONAL MODELING OF DISTRIBUTED PARAMETERS CONTROL SYSTEMS - THE CASE OF PARABOLIC PDEs . . . . .</b>	<b>69</b>
<b>9</b>	<b>BOUNDARY STABILIZATION AND FEEDBACK CONTROLLER SYNTHESIS VIA CONTROL LYAPUNOV FUNCTIONALS . . . . .</b>	<b>71</b>
9.1	Feedback stabilization <i>via</i> control Lyapunov functionals . . . . .	71
9.2	A case study: the feedback stabilization of the overhead crane with flexible cable . . . . .	72
9.2.1	The mathematical model . . . . .	72
9.2.2	The synthesis of the stabilizing controller . . . . .	74
9.2.3	Simulated experiments . . . . .	76
<b>10</b>	<b>NUMERICAL AND COMPUTATION MODELING FOR DISTRIBUTED PARAMETER SYSTEMS: APPLICATIONS . . . . .</b>	<b>79</b>
10.1	Introduction. Definition of the class of models . . . . .	79
10.2	An application for DPS with nonlinear boundary conditions: the torsional stick-slip oscillations in oil well drillstrings . . . . .	80
10.2.1	The mathematical model . . . . .	80
10.2.2	Numerical and computational modeling . . . . .	81
10.2.3	Simulated experiments . . . . .	84
10.3	An application for DPS with nonlinear boundary conditions and two time-scales from the Contact Mechanics field . . . . .	86
10.3.1	The mathematical model . . . . .	86
10.3.2	The energy identity . . . . .	87
10.3.3	Numerical and computational modeling . . . . .	88
10.3.4	Simulated results . . . . .	91
10.4	A system of conservation laws with bilinear terms in boundary conditions: the control of cogeneration . . . . .	94
10.4.1	The mathematical model . . . . .	94
10.4.2	Simulation results . . . . .	99
10.5	An application for DPCS with losses: the overhead crane with flexible cable . . . . .	102
10.5.1	Numerical modeling for losses processes – a case study . . . . .	103
10.5.2	Implementation by means of software emulated CNNs . . . . .	106
10.5.3	Simulated experiments . . . . .	110
10.6	An application for parabolic PDEs of type reaction-advection-diffusion: a nonlinear bioreactor distributed parameter model . . . . .	113
10.6.1	The mathematical model . . . . .	114

10.6.2 Numerical modeling .....	115
10.6.3 Computational modeling and implementation .....	116
10.6.4 Simulation Results. The steady-state profile .....	117
